

## Tube Master Instructions

---

NOTE – Most Tube Masters have a lined hose clamp. The liner tail can affect needle tension if it goes inside hose clamp relief, keep hose clamp rotated so tail is exposed.

- Using**
- 1 -The included sleeve is for use with our telescoping tubes.
  - 2 -Start with the needles pushed back, align notches on tube and then push needles to match rest of tube profile. You can also start with half needles out, but it's best to keep the longest needles back and push them out, since they are most likely to flex out.
  - 3 -The clamp has two stages, light tension will hold the Tube Master while allowing the needles to still be adjusted. Then you can tighten it to lock the needles down and then work on the other side of your tube.
  - 4 -When removing from test tube, loosen the clamp more than required to let it easily slide off and on the final tube to cope. Be careful not to touch the needles at this point.

This is a brand new product and we would like to hear how it works for you.  
A review on our website will also help others interested in this.
